Planets along the ecliptic, 2026 · January–June

Istanbul · 41.01° N, 28.98° E · every 7 days · times UTC+3

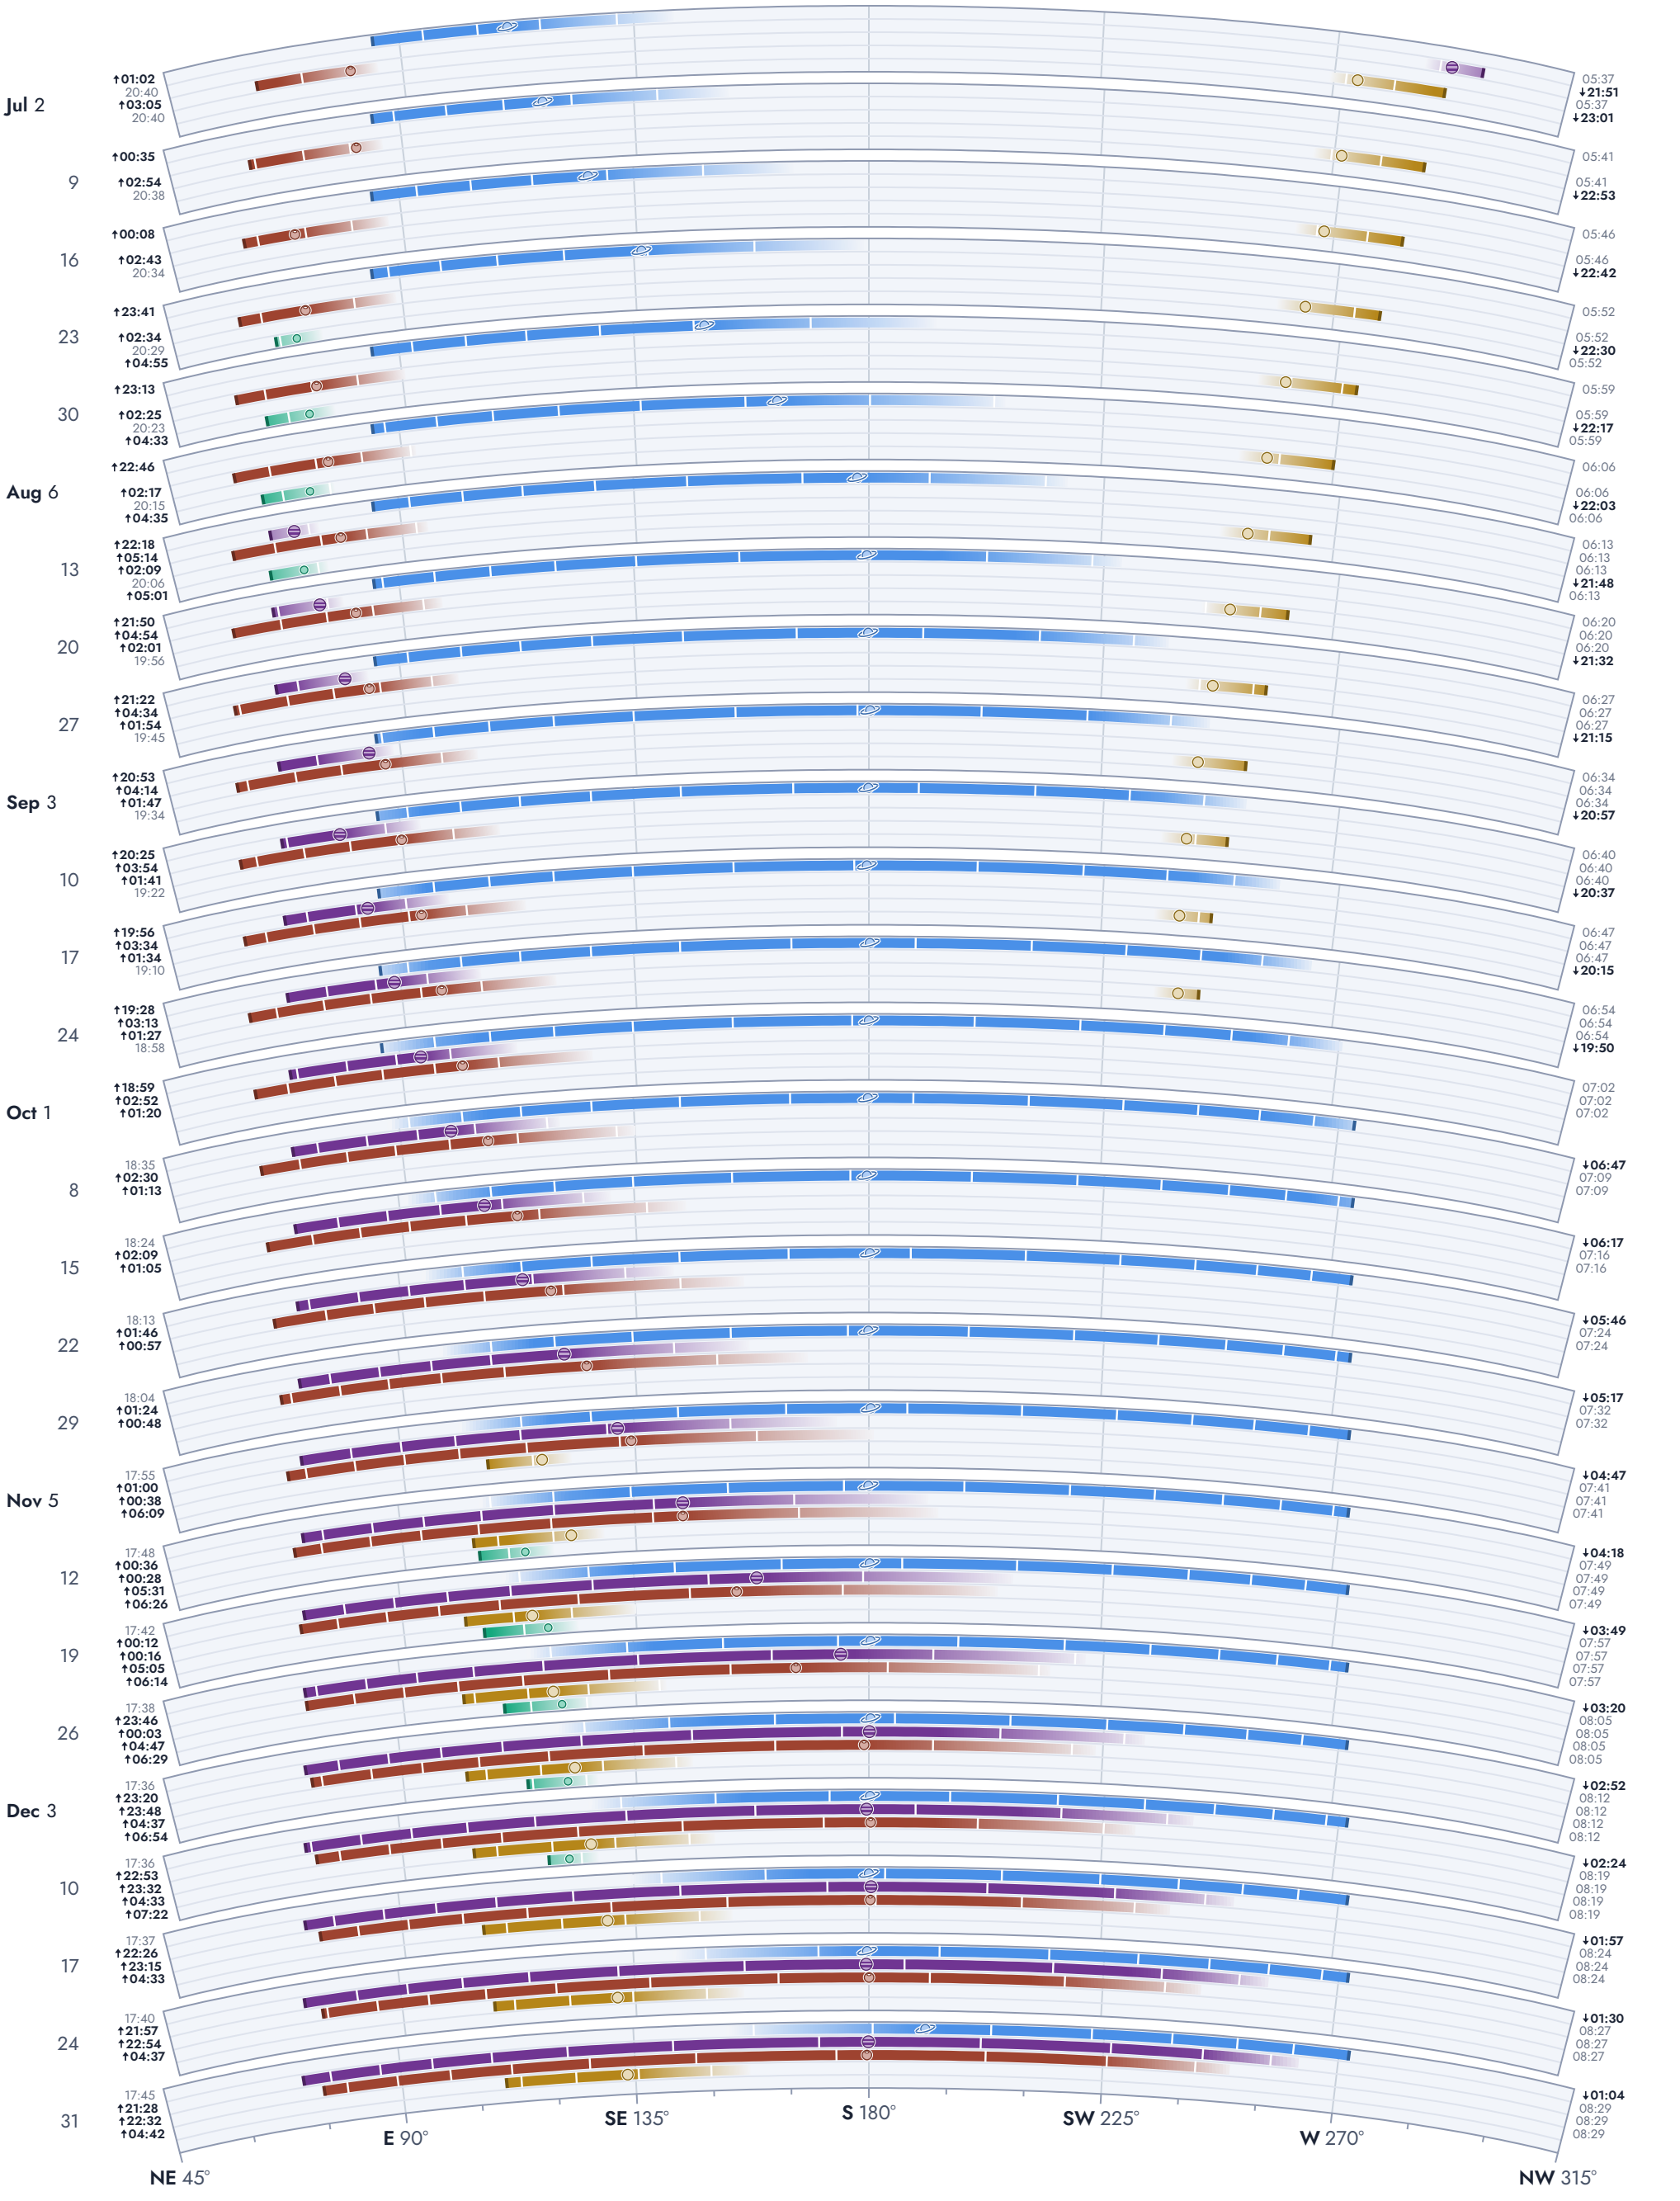

Mercury · Venus · Mars · Jupiter · Saturn · lighter in twilight, from sunset until full darkness; a cut at every full hour · rises or sets here

Each band is one night, every 7 days, with a lane per planet. Left to right is the compass direction you face, the same for every lane, so a planet's line starts where it comes into view and ends where it leaves. Times beside a band: left when the planet comes into view, right when it leaves. **Bold times with an arrow** are real rises and sets, at the dark bar on the line; plain grey times are sunset or sunrise, for a planet that is already up when the Sun sets or still up when it rises. Count the hour cuts from the first time to read the hour at any direction.
